

ABSTRACT OF THE DISCLOSURE

An exercise pediatric stationary tricycle is designed to look like a standard child's tricycle. It comes in bright, primary colors and has a large front wheel and two smaller rear wheels just like a normal tricycle. While the wheels are stationary, the pedals are designed to be driven by a programmable electric motor. The electric motor allows the adult to set the speed and length of time of the exercise. The seat and handlebars are adjustable in a horizontal direction. In addition, the handlebars are adjustable in a vertical direction. The attractive appearance and functional design of the exercise tricycle fulfills the need of some children with low or no muscle tone in their lower extremities to enjoy exercising their legs.
